

Jurisdictional-scale carbon accounting: evaluating options

The role of existing maps, data and webtools.

- To build MR(V) from scratch is expensive it takes time, time we do not have..... **it might not be necessary**
- Tree-cover loss/gain, annual, carbon, fires, much data exist already **build on it, don't reinvent it**
- Current global datasets are globally consistent and locally relevant..... They can be **used over a range of scales before they breakdown**
- No data is 100% right..... **but it never will**
- Countries/regions/districts working on improving data..... **have a reference point a dataset to validate , to improve**

Forest Information Challenges

An aerial photograph showing a large area of deforestation. A dirt road winds through a landscape where the dense green forest has been cleared, leaving behind a field of dead, brown tree trunks and branches. The remaining forest is visible in the upper left and right corners of the image.

Not timely

Not spatially explicit

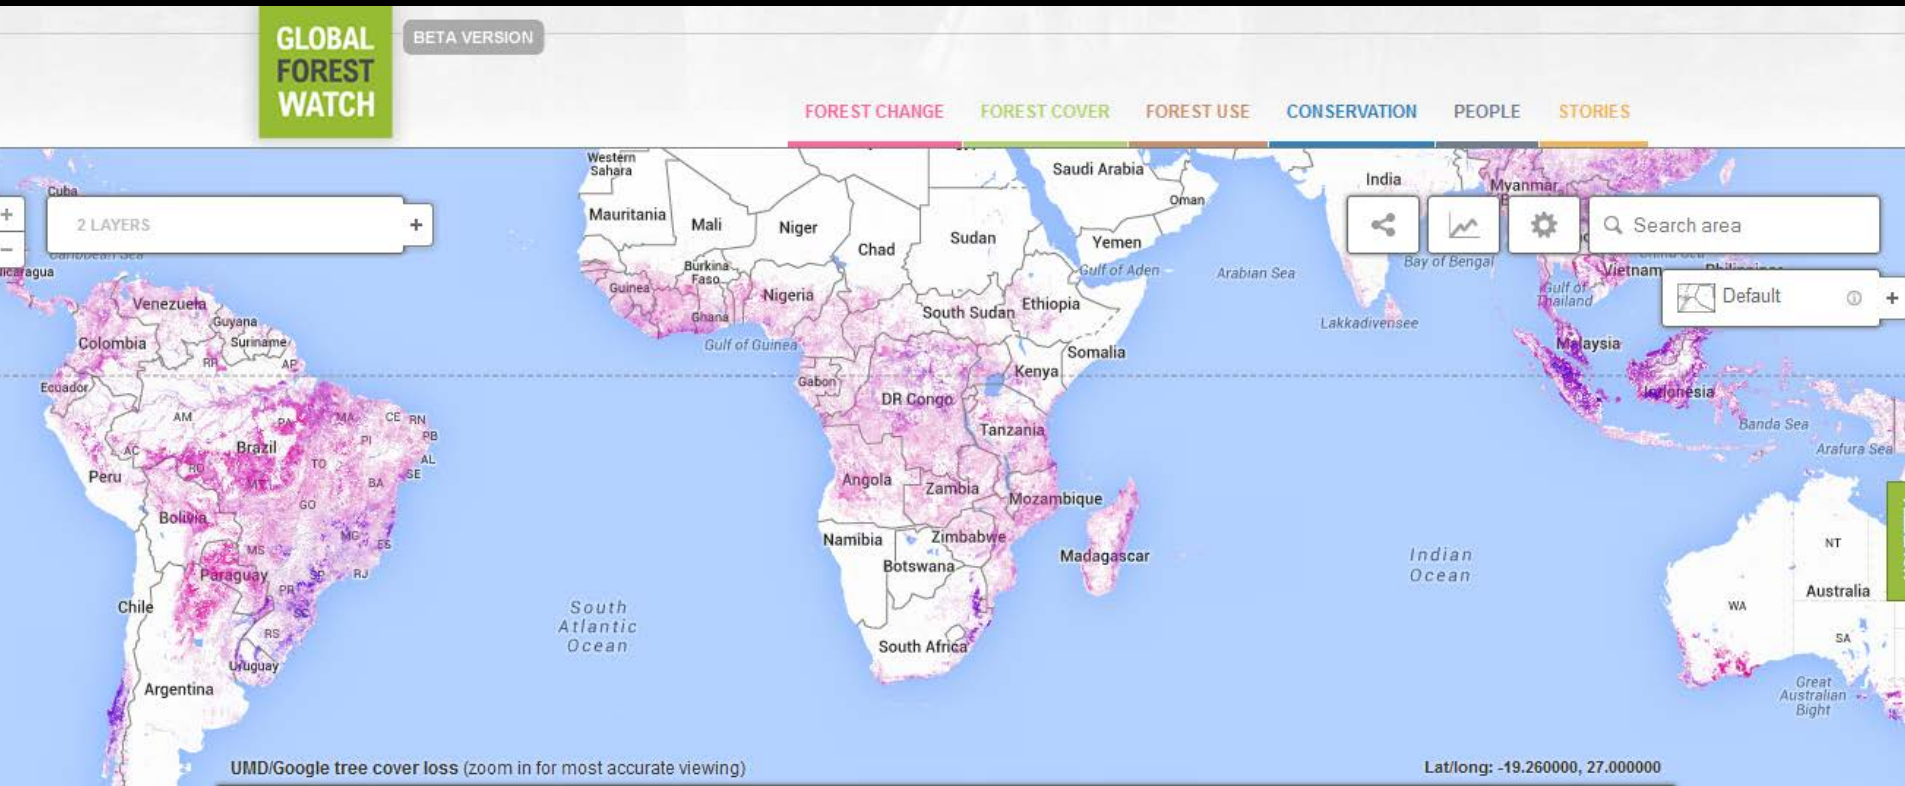

Not interactive

Not consistent and comparable

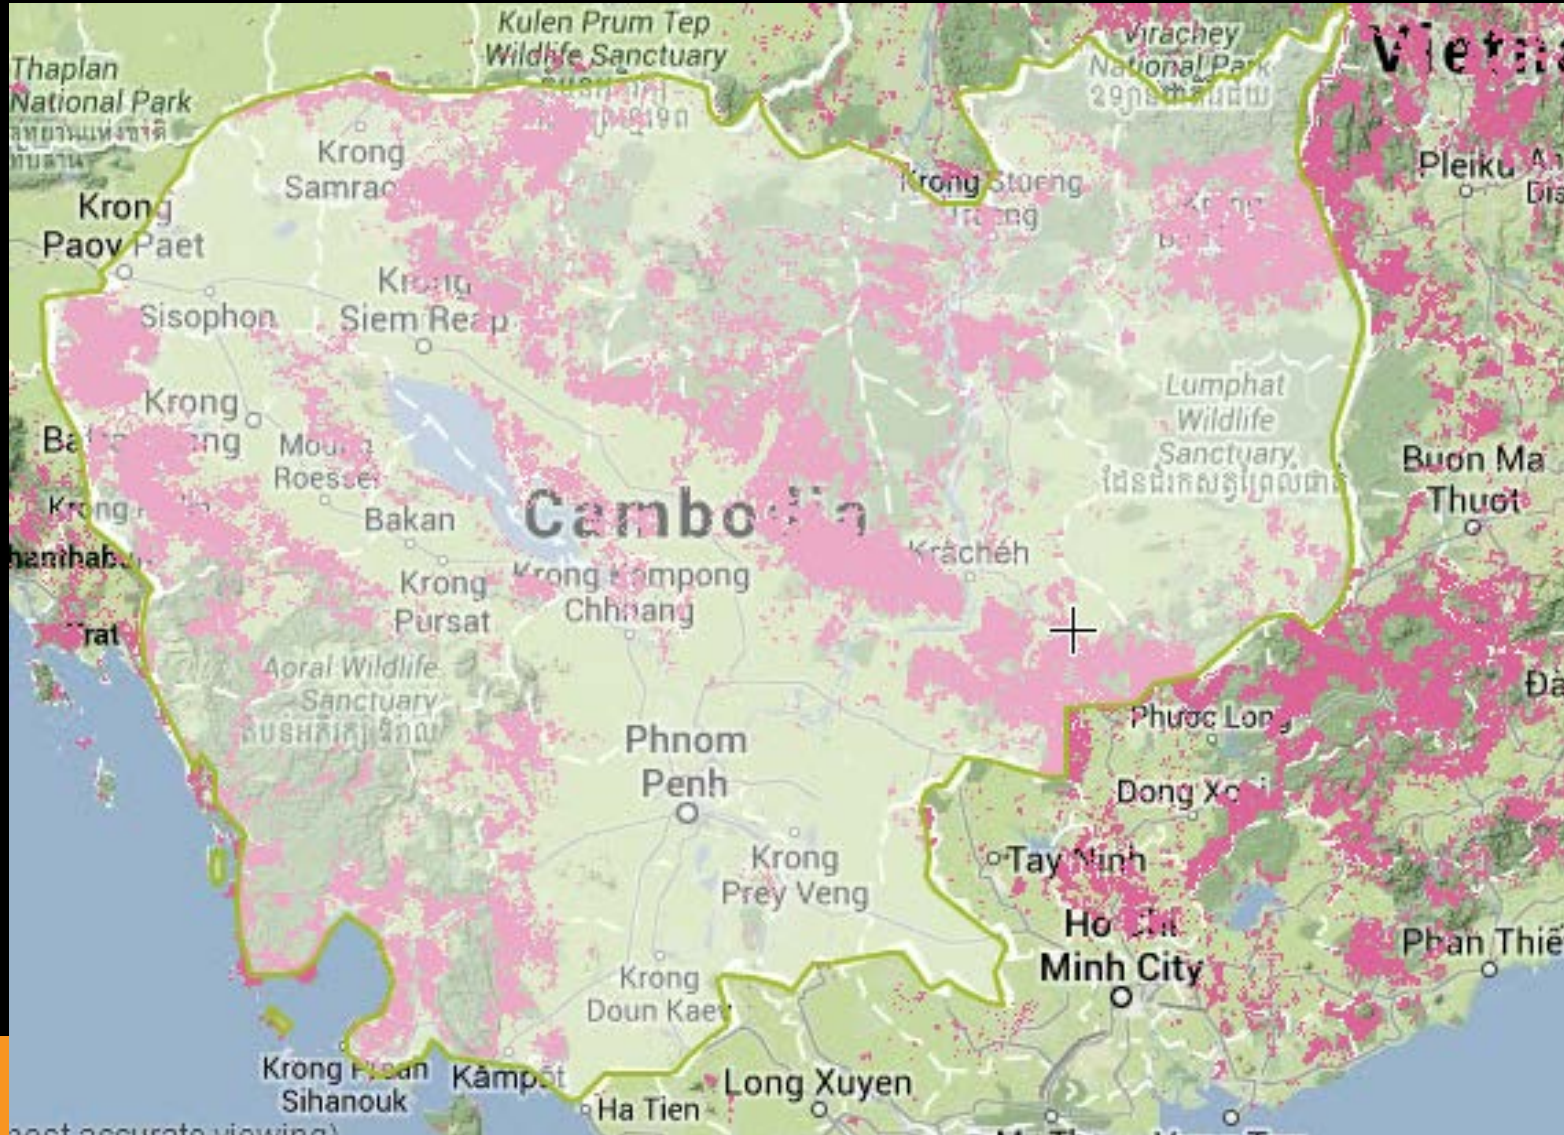

Not accessible

Not actionable – REL, annual, carbon

Bring together in actionable format

Data sources

Global Forest Watch hosts a wealth of data relating to forests. Some data have been developed by WRI or by GFW partner organizations. Other data are in the public domain and have been developed by governments, NGOs, and companies. The data vary in accuracy, resolution, frequency of update, and geographic coverage. The summaries below include links to further information such as methods and technical documents. Full download of the data sets is available for most sources.

DATA POLICY

Forest change

Forest change data measure tree cover loss, tree cover gain, or forest disturbance.

UNIVERSITY OF MARYLAND/GOOGLE TREE COVER LOSS	(annual, 30m, global)	✓
UNIVERSITY OF MARYLAND/GOOGLE TREE COVER GAIN	(12 years, 30m, global)	✓
FORMA ALERTS	(monthly, 500m, humid tropics)	✓
IMAZON SAD ALERTS	(monthly, 250m, Brazilian Amazon)	✓
QUICC ALERTS	(quarterly, 5km, <37 degrees north)	✓
NASA ACTIVE FIRES	(daily, 1km, global)	✓

Constantly improving

- Better data
- Country relevant data
- More data

- Specialized apps

Acquisition Strategy

Incorporate **publicly available data** (e.g. FAO Land Cover Data)

Build **relationships** through partnerships to move data into public domain (e.g. RSPO)

Finance the **creation of new datasets** to fill key data gaps (e.g. IFL 2010)

DATA PIPELINE | Forest Use

Logging Malaysia, Liberia, Indonesia, Cambodia

Mining Sierra Leone

Timber Malaysia, Liberia, Indonesia, Cambodia

Oil palm Cameroon

*Goal: concession data for all countries

NEW: Planted area. Transparent World

Malaysia, Liberia, Colombia, Indonesia, Brazil.

**Goal: global coverage*

An aerial photograph of a vast agricultural landscape, likely a sugarcane field, characterized by a grid of rectangular plots in various shades of green and brown. Two prominent, thick plumes of white smoke or steam rise from the ground, one in the upper left and another in the lower right, suggesting a process like controlled burning or a specific agricultural technique. The text "Partnerships, partnerships, partnership" is overlaid in a bold, yellow font across the center of the image.

Partnerships, partnerships, partnership
